

The DNR and MDE tell us that grasses are a natural and healthy for a lake such as Deep Creek Lake. There are portions of the lake that have a high concentration of grasses and other plant life that make normal lake recreation activities difficult, if not impossible. DNR Lake Management is presently engaged in a detailed scientific study of the lake and lake water quality that will address this topic. The POA is extremely supportive of this effort and is monitoring its progress and has established a committee of concerned citizens that is independently attempting to influence and integrate various efforts by multiple organizations contributing to the study.
